

# Create Faster Code — Faster

## Intel® Parallel Studio XE 2016 Intel Software Development Tools

---

### What it Does

- **Lets you develop faster code.** Boost application performance that scales on today's and next-generation processors.
- **Helps you code faster.** Use a toolset that simplifies creating fast, reliable parallel code.
- Includes high-performance compiler(s), libraries, parallel models, threading and vectorization advisor, memory/threading debugger, profiler, and more.

### What's New

- Make fast code using both vectorization and threading. Vectorization Advisor gives you the tools and tips to vectorize effectively in days instead of months.
- Boost the speed of data analytics and machine learning programs with the Intel® Data Analytics Acceleration Library (Intel® DAAL).
- Improve cluster performance by profiling MPI jobs faster (up to at least 32K ranks) using MPI Performance Snapshot.
- Much more...

You are developing software that needs to run faster. Your software performs big data analytics, medical imaging, time-critical financial analysis, simulations (e.g., CFD or weather) or one of thousands of tasks that need to get done *now*. You are already using incumbent development tools (e.g., GNU, XCode\* or Visual Studio\*) on Linux\*, OS X\*, and Windows\*.

What you need is a toolset that's compatible with the way you already work and makes it easier to speed code execution. Intel Parallel Studio XE is a performance tool suite that boosts application speed by taking advantage of the ever increasing core count and vector registers width available in Intel® Xeon® processors and Intel® Xeon Phi™ coprocessors.
